Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Replicable and transcriptionally active plasmid carrying signal peptide for specific target - useful for site directed mutagenesis and molecular therapy of genetic diseases.

Disclosure; Col 11; 24pp; German.

Two modified oligonucleotides (introducing PstI and XhoI sites) were used to amplify a region of the human mitochondrial (mt) genome contg. the light strand promoter, mEDNA ori of the heavy strand, CSB's ("conserved sequence blocks") and a regulation site for DNA replication. Behind this fragment (5' direction) a synthetic multiple cloning site was introduced, generating a product with overhanign ends. The synthetic region also introduced a bidirectional mt transcription termination sequence. The amplification product, synthetic fragment and pBluescript were ligated and recombinant plasmid 1 (AAT12315) was produced. Human mt 165 rRNA (differing from the native RNA only in having a modified nucleotide) was isolated by PCR from chloramphenicol resistant HeLa cells and inserted into plasmid 1 to form plasmid 2 (AAT12315). The cloned insert was

```
isolated as a Bsal fragment and cyclised using hairpin loop oligonucleotides, one of which carried the required signal peptide (the present sequence). The cyclised product was purified by treatment with exonuclease III. In a modification, the signal peptide was attached after cyclisation. The new plasmids were able to impart chloramphenicol resistance to otherwise sensitive B lymphocytes and fibroblasts. Similar plasmids without a signal peptide could not do this. The plasmids can be introduced into eukaryotic cells, esp. for site-directed mutagenesis or molecular therapy of genetic diseases, targetting nucleic acid in cells or their organelles via the protein transport route. New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in neuronal issue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal

invention

```
cubjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene the sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification) but was obtained in electronic form directly from WIPO at

The invention relates to a recombinant vector for expressing a fused protein containing a fused gene in which a base sequence defining a transfer signal peptide to small cellular organs having an extranuclear gene is combined with a base sequence defining the amino acid sequence a restriction enzyme recognising a defined base sequence. The vector is used for decomposing an extranuclear gene of a nonhuman organism. The present sequence represents the signal peptide of rat mitochondrial ornithine transcarbamylase (MOT) which may be used in the vector of the

```
The invention discloses a composition comprising two or more isolated rate or human polyuncleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a service that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating cotivity in an animal of one or more of the polypeptides or their antibodies. The polymucleotide or the compound that polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction

specification, a method for identifying a compound useful in treating

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also camprising the vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the machod, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                     Gaps

      pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (CNUD), in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Leber hereditary optic meuropathy; myoclonic épilepsy;

The method is used for treating a disease or disorder that arises from deletion of the protein-encoding genes of the mitochondrial genome. Alternatively, the method is used for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Functionally complementing one or more defects, mutations, or deletions in a mitochondrial genome of a cell, useful for treating diabetes with deafness, comprises introducing mitochondrial DNA into the nuclear

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for preparing a protein which interacts with the heat shock protein HSP47. The method involves the two-hybrid screening method using the HSP47 gene and a mammalian CDNA library. The HSP47 interacting proteins are useful for the diagnosis and treatment of diseases caused by an increase or decrease in activity of HSP47. The present sequence was used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        method to prepare proteins which interact
used for decomposing an extranuclear gene of a nonhuman organism. The present sequence represents the signal peptide of human mitochondrial ornithine transcarbamylase (MOT) which may be used in the vector of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and expression contg. a promoter operably linked to an antibody gene encoding an antibody which binds to a specific target antigen. The antibody is esp: a single chain antibody in which the heavy and light chain variable regions are joined via a hydrophilic linker peptide. Localisation sequences are pref. included in the constructs. The sequence AAR48260 is a mirochondrial matrix retention signal. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vector systems comprise a sequence adapted for intracellular delivery

Intracellular binding to a desired target by an intracellularly expressed antibody (i.e. an intrabody) can be used to knock out multiple locuses of immunomodulatory receptor molecules (IRMS), so that the expression of multiple major histocompatibility (MHC) molecules is blocked. This selective targeting of IRMS, their pathways or components, can be used to selectively regulate the immune system by controlling expression of these component of the MHC pathway or the MHC assembly line or antigen presentation can be targeted. Intrabodies can be used to knock out the presentation can be particular tissue or portion of the body to prepare in for cell or tissue transplantation. Alternatively, an organ for transplantation can be perfused with the intrabody ex vivo. The intrabodies can comprise whole antibodies, heavy chains, Fab' fragments, intrabolise and clabodies, heavy chains, Fab' fragments, intracellular localisation signal to facilitate interception of expressed proteins. For example, if the target was a cell surface receptor, the antibody would comprise a leader sequence and an endoblasmic reticulum (ER) or Colgi apparatus retention signal. This peptide is a localisation sequences for the mitrochondrial matrix. For other localisation sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Mitochondrial matrix localisation signal peptide.

à 셤 ABP56588

```
Identifying regulator polypeptides which influence target transcriptional regulatory regions, useful for treating cancer, comprises introducing host cells expressing the polypeptide into a library of polynucleotides.

Transcriptional regulatory region in a host cell. The method computes encoding a regulator polypeptide, whose expression induces activation of a target transcriptional regulatory region in a host cell. The method comprises providing a population of eukaryotic host cells. The method comprises polypeptide, introducing into the host cells. The target transcriptional regulatory region is perably associated with a polymucleotide and construct the recovering them from the host cells. The target transcriptional regulatory region is operably associated with a polymucleotide encoding a gene product, the expression of which results in host cell death or cause the host cells to exhibit a pre-determined modified phenotype and where the gene product is expressed upon activation of target transcriptional regulatory region. Each candidate regulator polypeptide comprises a candidate peptide and a molecular scaffold fused to the peptide so that the peptide is displayed on the surface of the candidate regulator polypeptide. The methods are useful in selecting and/or screening regulator molecules, such as polypeptides, which directly or indirectly induce or suppress the transcriptional activation of a target transcriptional regulatory region in a enkaryotic host cell. These regulator molecules may be used (e.g. in gene therapy) for preventing or transcriptional regulatory region in a enkaryotic host cell. These regulatory molecules may be used (e.g. in gene therapy) for preventing or transcriptional regulatory region in a enkaryotic host cell. These (e.g. arrhythmia, heart failure, isothemia), obesity, neurodegenerative diseases (e.g. Alzheimer's disease), bone pathologies, dermatologic diseases (e.g. Alzheimer's disease), bone pathologies, dermatologic diseases (e.g. Alzheimer's disease), bone pathologies, dermatologic diseases (e.g. Alzheimer's disease), bone pathologies dermatologic immunodeficiency syndrome (Albo, in important regulator molecules that in more anning regulator and in immunications and in wounted regions and in The invention discloses a method for identifying polynucleotides encoding resistance applications and in improving the performance of existing or developmental drugs. It may also be used in immunobiology, inflammation, allergic response and in biotechnology applications. The sequences presented in ABG92946-ABG93029 are examples of regulator polypeptides Disclosure; Page 37; 224pp; English.

(PNS) encoding an intracellular immunoglobulin molecule or its fragment whose expression induces a modified phenotype in a cukaryotic host cell (I). The method comprises introducing into (I) a first and second library of PNS encoding, through operable association with a transcriptional control region, first and second intracellular immunoglobulin subunit polypeptides, respectively. The method is useful for selecting colypeptides, respectively. The method is useful e.g. for identifying polynuclecting polynuclectines which encode an intracellular immunoglobulin molecule, or singly or collectively encode intracellular immunoglobulin molecules, or which sensitise host cells to killing by an agent. The method may also be used in cardiovascular applications; for screening for diminished carriptima potential in cardiomycoytes and for enhanced contractile carriptima potential in cardiomycoytes and faminish heart failure potential; for identifying intracellular immunoglobulin molecules that will regulate contractile cardiomycoytes and animish embolic phenomena in arteries and arterioles leading to strokes and angina; in screening for decreases candarterioles leading to strokes and angina; in screening for decreases in atherosclerosis-producing mechanisms to find intracellular; in setting immunoglobulin molecules that regulate LDL and HDL metabolism; in skin immunoglobulin molecules and in regulating or inhibiting keloid formation. the exemplification of the present invention

The present sequence is a localisation sequence that can be used to direct stabilised single-chain antibodies to the mitochondrial matrix. The N-terminus of the single-chain antibody is linked to a stabilising fusion peptide, referred to as a stabilon, which increases stability of the antibody against proteolysis in vivo. Degradation of the antibody may be modulated by linking the stabilon to the antibody through a protease-sentitive linker region. The stabilon is removed upon induction of expression of a specific restriction protease by means of an inducible promoter, and this renders the antibody susceptible to proteolysis by the
where it accumulates. Once released by antibody degradation, the drug is at an effective concentration only at the target site, with very little free drug being available in the rest of the body. The system of the invention therefore reduces the side effects caused by therapeutic agents, and also provides economic benefits as a smaller amount can be administered to the patient. Sequences AAB22835- AAB22837 and AAB22839- B22857 represent subcellular localisation sequences which can incorporated into a drug-specific antibody used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mitochondrial matrix localisation sequence; single-chain antibody; stabilon; stabilising fusion peptide; vaccine; gene therapy; protein degradation modulation; protein stability; Alzheimer's disease.

Target cells in a patient are transformed with an expression construct encoding an antibody (particularly a single chain antibody) to the drug to be delivered. The antibody contains a medulator of intracellular half-life; this can either be a stabilising or destabilising residue located in the N-terminus affer the initial methionine, or a peptide ("stabilon") containing a stabilising tresidue linked to the antibody N-terminus via a protease cleavage site. On administration of the drug, the antibody binds the drug, localising it at the target cells but maintaining it in an inactive state. As the antibody is degraded (the timescale for which is dependent upon the N-terminal or stabilon amino acids), the drug is released at its site of action where it can exert its effects. The antibody encoded by the expression construct (and therefore the ratebutic agent) can be targetted to particular subcellular locations therapeutic agent) by including the appropriat cellular localisation signals. The novel method may be used to deliver therapeutic agents to patients with a variety of conditions such as diabetes, autoimmune almost immediately localised at its site of action in an inactive form

The present invention relates to the isolation of novel human enzyme polypeptides, and the CDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the disorders including hyperproliferative disorders (e.g. cancer), immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. AlDS) autoimmune disorders (e.g. arthritis), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. influenza). The polymuclectides of the invention can also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention and also be used in gene therapy. AAU22915-AAU23814 represent the novel human enzyme polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the provention format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cancerous diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            26.0%; Score 56.5; DB 4; Length 149; 35.3%; Pred. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, or the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequence ABO67826-CC ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zyskind JW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

the full antisense to an included nucleic acts comprisens of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense concleic acid; (3) an antibody applied by the antisense contient acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway concluded for proliferation, or that inhibits callular proliferation; (8) identifying a gene required for callular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underspressed; (12) determining the extent to which each of the strains is present in a culture or collection of such product is overexpressed or underspressed; (12) determining the extent of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for and discovery programs. Or sometime the proversor and addition or antional actional act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   <del>.</del>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                      invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Secreted protein; Mycobacterium; primer; PCR; amplification; probe; hybridisation; infection.
homologous nucleic acids required for cellular proliferation to ate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5

                                                                                            Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of
                                                                                                                                                                               Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins
                                                                                                                                                                                         from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacterial infection; Pseudomonas aeruginosa infection; antibacterial

effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences of Pseudomonas species using biochip technology. Sequences ABOS7826-ABO84306 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polymucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging; diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent din not appear in the printed specification, but was obtained in electronic format directly from WIPO at the type. Wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher elekaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB5777-ABR2072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                             Gaps

represent novel Neisseria meningitis and N. gonorrheae polymucleotides represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ5457 to AAZ5456 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antegonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be
                                                                                                                                                                                                               Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Masignani V, Mora M;

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to stime polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms; for gene analysis and for detection/amplification of the genes are used for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microreganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful charpestive to P. luminescens and the proteins or are sensitive to P. luminescens and the proteins are as virulence in the protein of the genes and the proteins are as virulence in the protein of the genes and the proteins are as virulence in the proteins are and for identifying targets of human diseases for which P. In the protein of the genes and the proteins are as virulence in the proteins and genes and for identifying targets of human diseases for which P.
                                                                                                                                                                                                                                                                                           Antibacterial, fungicide, insecticide, polymorphism, genetic analysis, detection, food, gene expression, plant, animal, microorganism, toxin, antibiotic, biopesticide, virulence factor, disease model, plague,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for represents an E. faecalis polypeptide of the invention. This sequence

the invention fraction to an induced and condition where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antiennse
conclaint a polypeptide whose expression is inhibited by the antiennse
contisense nucleic acid; (4) an antibody capable of specifically binding
contisense nucleic acid; (4) an antibody capable of specifically binding
contisense nucleic acid; (4) an antibody capable of specifically binding
contiseration; (7) identifying a compound that influences the activity of
contiseration; (7) identifying a compound that influences the activity of
contiseration; (7) identifying a compound that influences the activity of
contiseration; (8) identifying a compound that influence the biological
contiseration; (1) identifying a compound that inhibite proliferation; (8)
contiseration; (1) identifying a compound that inhibite proliferation of an
corganism acts; (9) manufacturing an antibiotic; (10) profiling a
compound; activity; (11) a culture compound that inhibite proliferation of
compound; activity; (11) a culture computating at confiction of
confound; of the strains is present in a culture or collection of
confound; of an organism. The antisense nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids required
confound activity; (1) activity in a confidence or acids are useful for
confound activity; (1) activity of the activity activity of activity activ
                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at

```
The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or screening for the presence of a disease or disorder. The complexes and methods above are useful in diagnoshin or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).
                                                                                                                                                                                                                                                                                                                                                                                                            New proteins and protein complexes from eukaryotes, useful as targets in diug screening, or in diagnosing or screening for the presence of a disease or disorder, or a predisposition for developing a disease or disorder in a subject.
                                                                                                                                                                                                                                                   Bauer A, Gavin A, Superti-Furga G, Kuester B, Schultz J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY5941 represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ5457 to AAZ5456 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the imvention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be used in gene therapy protocols
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                  The crystal protein is toxic to insects of the order Lepidoptera or Coleoptera, it is therefore useful in the protection of crops which are subject to infestation withlepidopterous or coleopterous insect pests. The crystal protein is formulated into a spray so that the protein agent is applied to crops at an amount of 0.1 to 5kg per hectare. Plants to be protected by such methods include vegetables such as cauliflower and cabbage, fruit trees such as citrus and apples, grains such as rice, wheat and beans and industrial crops such as tea and sugarcane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants,
                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therespectics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), and the encoded proteins (ABBZ7373-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibacterial; fungicide; insecticide; polymorphism; genetic analysis;

 The
animals or microorganisms other than P. luminescens and are able to alter
 response or sensitivity to toxins and antibiotics produced by P. Iuminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
 domain,
 Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.
 The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase doma derived from a bacterial daptomycin biosynthetic gene cluster. The proteins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodularcor, antilipemic, and cytostatic activity. polynucleotides may have a use in gene therapy. The compositions and

New isolated nucleic acid molecule encoding a daptomycin non-ribosomal peptide synthetase, useful for treatment of a gram-positive bacterial infection of skeletal muscle, skin, bloodstream, kidneys, heart, lung and
methods of the present invention are useful for generating novel linear and cyclic peptides and improving yield of a product in a cell expressing an daptomycin non-ribosomal peptide synthetase (NRPS) to be used as new compounds or in producing new compounds, such as antibiotics, antifungals, antivirals, antiparasitics, antimitotics, antitumonalulatory agents, anti-cholesterolemic agents, siderophores, agrochemicals and cytostatics. The sequence represents a S. roseosporus daptomycin non-ribosomal peptide synthetase of the invention
 The invention relates to new isolated nucleic acid (NA) molecules from the Streptomyces roseosporus daptomycin biosynthesis gene cluster, especially adaptomycin non-ribosomal peptide synthetase (NRPS) or its subunit, where the (NA) molecule encodes DptBC, and is not pRHB159. The methods and compositions of the present invention are useful for treatment of a gram-positive bacterial infection of any organ or tissue in the body, including skeletal muscle, skin, bloodstream, kidneys, heart, lung and bone. This sequence represents the daptomycin blosynthesis protein DptD.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungal agent, an antifungal agent that inhibits the growth of a fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus or disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, activity, The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and catabolism, activity or activity, the method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and essential candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed or specification by the present endement of the invention.

ATTORNEY/AGENT INFORMATION:
 ANTI-SENSE: NO SEQUENCE DESCRIPTION: SEQ ID NO: 2: US-09-950-046A-2
 Sequence 229228, Application US/10424599
 TYPE: amino acid
STRANDEDNESS: not relevant
TOPOLOGY: not relevant
MOLECULE TYPE: protein
HYPOTHETICAL: NO
 INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 1164 amino acids
 Sequence 2, Application US/09950046A Patent No. US20020151701A1 GENERAL INFORMATION:

ornithine carbamoyltransferase (EC 2.1.3.3) precursor - rat
NyAlternate names: citrulline phosphorylase; ornithine transcarbamylase
C;Species: Rattus norvegitus (Norway rat)
C;Date: 28-Feb-1986 #sequence revision 28-Feb-1986 #text change 09-Jul-2004
C;Date: 28-Feb-1986 #sequence revision 28-Feb-1986 #text change 09-Jul-2004

 -!- ENZYME REGULATION: Inhibition by ornithine increases at higher ph.
-!- BATHMAY: Second step in urea cycle, arginine biosynthesis.
-!- SUBGUNIT: Homotrimer.
-!- SUBGELULAR LOCATION: Mitochondrial matrix (By similarity).
-!- TISSUE SPECIFICITY: Expressed in kidney, brain, heart, liver, pancreas, gizzard, small intestine and breast muscle. More abundant in mitochondrion-rich organs (heart, liver and brain) than in other organs. Activity detectable in embryos by day 14.
-!- DEVELOPMENTAL STAGE: Activity detectable in embryos by day 14.
-!- INDUCTION: By diet of egg yolk in animals which have a high level of OTC activity due to presence of OCB gene.
-!- PTM: Cleavage of the precursor form to the active form occurs only
 0.11 to 0.034 mM depending on pH. SIMILARITY: Belongs to the ATCase/OTCase family.
 Biochem. Genet. 25:259-266(1987).
-1- CATALYTIC ACTIVITY: Carbamoyl phosphate + L-ornithine = phosphate
+ L-citrulline.
 in the kidney.

-!- MISCELLANEOUS: Ornithine transcarbamylase activity varies within and between different breeds of chicken. The pH optimum varies according to ornithine concentration. Km for L-ornithine varies from 0.19 to 1.21 mM and Km for carbamyl phosphate varies from

Helbing C., Gergely G., Arkinson B.G., "Sequential up-regulation of thyroid hormone beta receptor, ornithine transcarbamylase, and carbamyl phosphate synthetase mRNAs in the liver of Rana catesbeiana tadpoles during spontaneous and thyroid hormone-
 Rep. Fac. Sci. Shizouka Univ. 29:45-54(1995).

-!- FUNCTION: OTC is necessary for the tadpoles transition from an ammoncellic, aquatic larva to a ureotelic, terrestrial adult.

-!- CATALYTIC ACTIVITY: Carbamoyl phosphate + L-ornithine = phosphate
+ L-citrulline.
 Dujon B., Sherman D., Fischer G., Durrens P., Casaregola S., Lafontaine I., de Montigny J., Marck C., Neuveglise C., Talla E., Goffard N., Frangeul L., Aigle M., Anthouard V., Babour A., Barbe V., Barnay S., Blanchin S., Beckerich J.M., Beyne E., Bleykasten C., Boisrame A., Boyer J., Cattolico L., Confanioleri F., de Daruvar A., Despons L., Fabre E., Fairhead C., Ferry-Dumazet H., Groppi A., Hantraye F., Hennequin C., Jauniaux N., Joyet P., Kachouri R., Kerrest A., Koszul R., Lemaire M., Lesur I., Ma L., Muller H., Nicaud J.M., Nikolski M., Oztas S., Ozier-Kalogeropoulos O., Pellenz S., Potier S., Richard G.F., Straub M.L., Suleau A., Suleau A., Zavanovic I., Bolocin-Pukuhara M., Thierry A., Bouchier C., Caudron B., Scarpelli C., Gaillardin C., Weissenbach J.,
